Dynamic programming is both a mathematical optimization method and a computer programming method. The method was developed by Richard Bellman in the 1950s and has found applications in numerous fields, from aerospace engineering to economics.. In both contexts it refers to simplifying a complicated problem by breaking it down into simpler sub-problems in a recursive manner.

Dynamic programming - Wikipedia

The core idea of dynamic programming is to avoid repeated work by remembering partial results. This is a very common technique whenever performance problems arise. In fact figuring out how to effectively cache stuff is the single most leveraged th...

What are some real life applications of dynamic programming?

A general dynamic programming model can be easily formulated for a single dimension process from the principle of optimality. The programming situation involves a certain quantity of economic resources (space, finance, people, and equipment) which can be allocated to a number of different activities.

Dynamic programming is breaking down a problem into smaller sub-problems, solving each sub-problem and storing the solutions to each of these sub-problems in an array (or similar data structure) so each sub-problem is only calculated once. It is both a mathematical optimisation method and a computer programming method.

Dynamic programming deals with sequential decision processes, which are models of dynamic systems under the control of a decision maker. At each point in time at which a decision can be made, the decision maker chooses an action from a set of available alternatives, which generally depends on the current state of the system.
