SLIDING FILAMENT THEORY WORKSHEET 1. When the muscle cell is in a resting state, the two strands are not in contact with one another. 2. When your nerves send a message to your muscles, these two protein strands reach out and touch one another. The movement that occurs gives us the name sliding filament theory. 3.

Next, discuss your predictions with your group members and develop a definition of the sliding filament theory with regard to thick and thin filaments. The length of muscle determines the relationship between the thick and thin filaments. The amount of overlap determines the number of potential cross bridges that may be formed.

Sliding Filament Theory Worksheet Answers

At a very basic level, each muscle fibre is made up of smaller fibres called myofibrils. These contain even smaller structures called actin and myosin filaments. These filaments slide in and out between each other to form a muscle contraction hence called the sliding filament theory! The diagram above shows part a myofibril called a sarcomere.

Answers: 1. The lack of ATP affects step 3 of the sliding filament model. Without ATP, the myosin heads remain attached to the actin filament. The muscles will stay contracted leading to the stiffness seen in rigor mortis. 2. If AChE does not work, ACh cannot be broken down and remains attached to the receptors on the motor end plate.
